RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 48 pages. Original publisher: Albany, Calif. : U. S. Dept. of Agriculture, Forest Service, Pacific Southwest Research Station, 2003 LC Number: SD11 . P34 no. 249 OCLC Number: (OCoLC)55995796 Subject: Deer hunting -- Economic aspects -- California, Southern. Excerpt: . . . Description of GIS-Based Micro Regression Variables Elevations (AvgElev) (meters) are based on USGS digital elevation models (DEMs) and act as a proxy for vegetation types that were not available. However, we do not have an expected sign on elevation, but simply wish to control for elevation differences between the 37 individual hunting areas with-in the SJRD. Both fire variables, wildfire (WildFire) and prescribed fire (RxBurn) (total acres year), are expected to have a positive sign (Kie 1984, Zedler and others 1983). The distance (meters) to road (LDirtDist) and trail (LTrailDist) variables are based on the distances from a central point in each hunting location. Two argu-ments can be made about the signs direction. One argument is based on accessibility for hunters, in which having a close proximity to either a trail or road would make hunting easier, more desirable, and would positively affect deer harvest. The second argument is based on the intrusion of deer habitat by a road or trail. This perspective would lead to a decline in deer harvest because roads cause a break in habitat and pose a threat. Therefore, the expectation is ambiguous. The distance (meters) to fire variable (LDistFire) is a measure of how close fire comes to burning into the interior of the hunting areas vegetation. A value of zero would indicate a fire in that...
